

## **MUST READ: Redux createStore() is (not) deprecated**

In the next lectures, you'll learn about Redux and how to use it. As part of these lectures a so-called Redux store will be created with help of a function called `createStore()`.

When using that function in your code, you might get a **deprecation warning** by your IDE or when running the app.

### **You should ignore this warning!**

You can still use `createStore()` without issues.

Indeed, the React Redux team now recommends the usage of an extra package called **Redux Toolkit** and another way of creating the Redux store. That package will **indeed be covered a little bit later in the course** as well. But by first diving into `createStore()` and the next lectures, you'll learn how Redux works and what it does. This is some crucial knowledge that's required no matter if you're then using Redux Toolkit (as mentioned: Covered later as well) or not!
